

MIDI notes to project markers

Turns every MIDI note into a project marker, named after the note and coloured by pitch — so you can write your cue rhythm as MIDI and get the markers for free.

Use the shortcut you assigned during install — or run it from [Actions](#) → [Show Action List](#)

WHAT IT IS FOR

Placing cues by ear, one marker at a time, is slow and never quite tight. Playing them in as MIDI is fast, quantises to the grid, and can be edited like music. This plugin takes that MIDI item and puts a marker at the start of every note.

Each distinct note name gets its own colour, so a kick pattern and a hat pattern are visually separate on the ruler — and since colour is what splits cue lists in MA-Tools, the sequences fall out of that automatically.

STEP BY STEP

1 Select the MIDI item

Click the item in the arrange view. If you want several, select them all — or skip this and use the whole project in the next step.

2

Start the plugin

Run **MIDI notes to project markers** — with the shortcut you assigned, or from the Action List. The window tells you how many items are currently selected, so you can check before committing.

The line under the switch previews the naming, and the count at the bottom tells you what you are about to convert.

3

Choose the naming

MA-Tools syntax is on by default: a C4 becomes `C4(1)[Top]^C4^`, ready to trigger. Switch it off if you just want the plain note name — `C4` — for example when you intend to run *Rename selected markers* over them afterwards.

If the track has custom MIDI note names, those are used instead of the pitch. Name your notes *KickStart* and *Hihat* in REAPER and the markers arrive already carrying those names.

Choose the scope

All MIDI items in the project

Every MIDI item, regardless of selection.

Only selected MIDI items

Just what you picked in step 1.

markers created.

Markers created — one per note, named after the note, each note name in its own colour.

GOOD TO KNOW

Looped items are followed

If the item loops its source, markers are created for every repetition you can see — across the item's full visible length, not just the first pass.

It warns before flooding your project

Above 2000 markers the plugin counts first and asks whether you really want them. A dense 16th-note pattern over a whole song adds up quickly, and undoing several thousand markers is no fun.

Markers land on note starts

Note length is ignored — only the start matters, which is what a cue trigger needs. So write your cue rhythm with short notes; it makes the MIDI easier to read without changing the result.
